

Sep 16, 14 9:59	install.Readme	Page 1/2
1. Code retrieval		
-----		
Download the latest Lagranto version from SVN repository <https://svn.iac.ethz.ch/websvn/pub/wsvn/>.		
Then create a directory where you want Lagranto to be installed; place the whole source code in this directory and set an environment variable {LAGRANTO} pointing to this directory.		
> setenv LAGRANTO {PATH TO YOUR LAGRANTO INSTALLATION}		
2. Compiling the Lagranto code		
-----		
Choose the correct Fortran compiler in <install.csh>. At the moment, PGI is set. I have successfully compiled the code with <ifort> and <gfortran>, so you might want to use one of these two compilers. You additionally have to set in <install.csh> the environment variable <NETCDF> which points to the installation of the netCDF libraries.		
> setenv NETCDF {PATH TO YOUR NETCDF LIBRARY}		
> cd \${LAGRANTO}/		
> ./install.csh clean		
> ./install.csh lib		
> ./install.csh create_startf		
> ./install.csh caltra		
> ./install.csh trace		
> ./install.csh select		
> ./install.csh density		
> ./install.csh lidar		
> ./install.csh goodies		
> ./install.csh docu		
> ./install.csh links		
Add the end of the installation, it's best to add the following directory to your PATH variable. In <bash> this should look like		
> export PATH=\${LAGRANTO}/bin/:\$PATH		
If the <LAGRANTO/bin> directory is in your PATH, then you will be able to run Lagranto from any directory. Otherwise, you will always have to give the full path to your Lagranto commands, e.g.		
> \${LAGRANTO}/bin/caltra		
3. Compiling the Grib-netCDF converter		
-----		
In the subdirectory <convert/fgrb2cdf> you find the program you find the Fortran program which we use to convert the Grib files from ECMWF into netCDF. Note that we use a somewhat 'strange' netCDF format; therefore you have to use this converter. In the near future, I will make available a conversion tool based on the CDO tools...		
You will have to set some paths to compile the program; in particular, a reference must be made to the GRIB_API.		

Sep 16, 14 9:59	install.Readme	Page 2/2																																				
4. Lagranto documentation																																						
-----																																						
Lagranto comes with a detailed documentation; you can start it with one of the following calls:																																						
> lagrantohelp																																						
> lagrantohelp tutorial																																						
> lagrantohelp reference																																						
The most important program for you will be <caltra> which calculates the trajectories...																																						
> lagrantohelp caltra																																						
5. Test data set																																						
-----																																						
On our FTP server you find a sample data set which allows you to run Lagranto without bothering about the Grib-netCDF conversion.																																						
ftp://iacftp.ethz.ch/pub_read/sprenger/lagranto.ecmwf.test/																																						
6. Minimal test run																																						
-----																																						
a) Define a starting position in a file <startf>; the format is <longitude latitude pressure>.																																						
> more startf																																						
8.0 46.0 500.																																						
-10.0 30.0 850.																																						
Each line corresponds to a single starting position. Note that longitudes must be within -180 ... +180 deg.																																						
b) Start the trajectory																																						
It is a forward trajectory starting at 00 UTC 1 Jan 2012. The time span is 18 UTC. Starting positions are taken from <startf>, the output is written to <trajectory>. For details about the optional flag <-j> and <-notimecheck>, please consult the Lagranto help <lagrantohelp caltra>.																																						
> caltra 20120101_00 20120101_18 startf trajectory -j																																						
> more trajectory																																						
Reference date 20120101_0000 / Time range 1080 min
